

Carlos Vega Rodríguez

Senior AI Architect & Full-Lifecycle Software Engineer

15+ years of software engineering, still actively shipping production code across React, Next.js, React Native, and AWS. Helps engineering organizations adopt AI in day-to-day work: shared conventions, review discipline, and repeatable AI-driven workflows that keep code consistent and quality high as teams scale. Works the full development cycle, from business goals to architecture and delivery.

Experience

Senior AI Architect & Full-Lifecycle Software Engineer · 18Techs

SEP 2016 — PRESENT

Freelance / Contract · Remote · React Native · React Query · AWS · TypeScript · Next.js · Angular · React

- Implement AI-driven development-lifecycle practices into day-to-day processes.
- Deliver full-cycle product engineering across a portfolio of clients — mobile front ends, cloud back ends, and delivery.
- Standardize stacks, conventions, and CI/CD so teams ship consistently and resiliently.

// SELECTED CLIENT WORK

SOCIAL **munity**

Product, Software & AI Implementation Architect

Cross-platform community & social media app (iOS + Android) — media capture/upload, reactions, activity feeds, real-time chat, i18n, durable upload queues, plus a Next.js admin panel and web invite system.

- Technical anchor of the current munity app — built and evolved it with AI woven through architecture, implementation, and review, and guided every contributor the project has had.
- Co-developed an AI-assisted delivery workflow linking project-management tasks to GitHub PRs, and set the team standard for traceability via conventional commits that reference each task ID.
- Built AI-assisted onboarding tools and self-guided codebase walkthroughs for new personnel, freeing senior-engineer time otherwise spent on ramp-up.
- Designed and shipped LLM-based content moderation for user-generated content.
- Primary engineer since 2021 and the largest individual contributor across 4+ years of continuous delivery.
- Established the React Native + React Query server-state standard and app-wide caching architecture.
- Owned release and delivery — OTA update pipeline, build tooling, and CI for production rollouts.
- Hardened authentication and reliability — refresh-token rotation, idempotency, and offline-resilient caching.

React Native · React Query · Next.js · AWS · LLM

AUDIT **Zinc.Tech**

AI-assisted Application Audit & Consultant

Independent, AI-assisted audit of a Java enterprise application (property-collections software), its REST API, and AWS architecture — a prioritized set of recommendations delivered to the client's engineering team.

- Reviewed the REST API and found roughly 40% of endpoints duplicated across roles; proposed an endpoint-by-endpoint consolidation strategy to remove dead code and realign business logic while keeping controllers live.
- Assessed AWS architecture and operational readiness — environment/region strategy, knowledge-transfer gaps, and the absence of security and load testing ahead of scaling.
- Evaluated client-side error handling and recommended error categorization, timeout and feedback loops, and clearer system-status indicators to eliminate stuck loading states and false-success outcomes.
- Delivered a prioritized, business-aligned remediation plan for the client's engineers.

Java · REST APIs · AWS · AI-assisted code analysis & audit

AD-TECH **QUAD**

Senior Cloud & DevOps Engineer

Complex, high-volume, always-available online ad delivery platform for a Stockholm-based ad-tech company — collaborated on system design and scaled cloud services for real-time ad delivery and reporting, operated in production and engineered for scalability and resiliency on AWS with Kubernetes.

MOBILITY **Envoy**

Senior Mobile Application Engineer

EV car-sharing app (“Mobility as an Amenity”) — app-based reservations, keyless vehicle access, and property-scoped fleet flows.

AI in the Loop

AI integrated into the development process, with guardrails that protect quality and consistency at team scale.

- Implement standardized development processes and integrate AI into them across engineering organizations.
- Champion shared conventions, review discipline, and repeatable AI-driven workflows.
- Enforce guardrails against “AI slop” — AI-generated code meets the same bar as hand-written, via review, linting, and CI.
- Coach developers on AI pairing with Claude, Codex, and Cursor for architecture, refactors, and review.

Open Source

@storybook/angular

★ initial developer

Initial developer of Storybook for Angular (v1) — brought the industry-standard UI component workshop to the Angular ecosystem. Storybook is used by teams at scale across the web platform.
